Trust Boundaries

The trust boundaries for our StockTrader project are based on our layered architecture. Here is a visual representation:

```
Presentation ← Trust Boundary
    Application
        Domain ← Trust Boundary
        Technical Services
```

There are two trust boundaries which separate the trustworthy internal collaborations from external, untrusted collaborations. We cannot trust information passed from the presentation layer to the application layer as this will likely be information from an unknown source (the user). Also, any information coming from the external database cannot be trusted and must be checked. The presentation and technical services layers can, however, trust information they receive from the application and domain layers.
